

1 Background

Floating Point ($\mathbb{F}$): A number = mantissa $\times$ base^{exponent} (e.g. $2048 = 1 \times 2^{11}$ mantissa=1, base=2, exponent=11)

Assumptions: There is $\varepsilon_m > 0$ (**machine epsilon**) **A1:** $\forall \alpha \in \mathbb{R}, \exists \varepsilon \in (-\varepsilon_m, \varepsilon_m)$ s.t. $fl : \mathbb{R} \rightarrow \mathbb{F}$ by $fl(\alpha) = \alpha(1 + \varepsilon)$
 $\varepsilon_m \approx 2.22 \times 10^{-16}$ **A2:** $\forall \alpha, \beta \in \mathbb{F}, \forall * \in \{+, -, \times, \div\}, \exists \varepsilon \in (-\varepsilon_m, \varepsilon_m)$ s.t. $\alpha \otimes \beta = (\alpha * \beta)(1 + \varepsilon)$
A1: The rounding error in α is relative to the size of α ($|\alpha - fl(\alpha)| < |\alpha|\varepsilon_m$) **A2:** The error in $\alpha \otimes \beta$ is relative to the size of $\alpha * \beta$ ($|\alpha \otimes \beta - \alpha * \beta| \leq |\alpha * \beta|\varepsilon_m$)

Cost of Algorithm (C): $C :=$ number of floating point operations (FLOPs) If $C(n) \leq \alpha f(n), \Rightarrow C(n) = \mathcal{O}(f(n))$.

· We consider that: 交换/赋值/相反数 no cost (i.e. Permutation **P** is free), 比较两数 1 FLOPs, $\sqrt{\quad}$ 1 FLOPs.

Norms: $\|\mathbf{x}\|_p := (\sum_{i=1}^n |x_i|^p)^{1/p}, p \geq 1$ $\|\mathbf{x}\|_\infty := \max_{1 \leq i \leq n} |x_i|$ $\|\mathbf{x}\|_2 := (\sum_{i=1}^n |x_i|^2)^{1/2}$ $\|\mathbf{x}\|_1 := \sum_{i=1}^n |x_i|$

- $\|\mathbf{x}\|_p \geq 0$ $\|\mathbf{x}\|_p = 0 \Leftrightarrow \mathbf{x} = \mathbf{0}$
 - $\|\alpha \mathbf{x}\|_p = |\alpha| \|\mathbf{x}\|_p$ for $\alpha \in \mathbb{R}$
 - $\|\mathbf{x} + \mathbf{y}\|_p \leq \|\mathbf{x}\|_p + \|\mathbf{y}\|_p$ (Triangle inequality)
 - Induced Norm:** $\|\mathbf{A}\|_p := \sup_{\mathbf{x} \neq \mathbf{0}} \frac{\|\mathbf{Ax}\|_p}{\|\mathbf{x}\|_p} = \sup_{\|\mathbf{x}\|_p=1} \|\mathbf{Ax}\|_p$
 - $\|\mathbf{A}_{m \times n}\|_\infty := \max_{1 \leq j \leq m} \sum_{i=1}^n |a_{ij}|$ (maximum row sum)
 - $\|\mathbf{A}_{m \times n}\|_1 := \max_{1 \leq i \leq n} \sum_{j=1}^m |a_{ij}|$ (maximum column sum)
 - $\|\mathbf{A}_{m \times n}\|_2 := \sqrt{\rho(\mathbf{A}^\top \mathbf{A})}$ $\rho(\mathbf{A}^\top \mathbf{A}) = \max\{|\lambda| : \lambda \text{ is eigenvalue of } \mathbf{A}^\top \mathbf{A}\}$
- For Matrix:** $\|\mathbf{Ax}\|_p \leq \|\mathbf{A}\|_p \|\mathbf{x}\|_p$ $\|\mathbf{AB}\|_p \leq \|\mathbf{A}\|_p \|\mathbf{B}\|_p$ $\|\mathbf{A}^k\|_p \leq \|\mathbf{A}\|_p^k$ $\|\mathbf{A} + \mathbf{B}\|_p \leq \|\mathbf{A}\|_p + \|\mathbf{B}\|_p$

2 Methods for Systems of Linear Equations (SLE)

Ideal: We want to solve SLE: $\mathbf{Ax} = \mathbf{b}$, where $\mathbf{A}_{n \times n}$ is invertible, $\mathbf{x}, \mathbf{b} \in \mathbb{R}^n$

2.1 Backward Stable | Condition Number | Error

Backward Stable: An algorithm to solve SLE is Backward Stable if: $\exists \alpha(n) > 0$ s.t. $\forall \mathbf{A}, \mathbf{b}$, the computed solution $\hat{\mathbf{x}}$ satisfies:

$$(\mathbf{A} + \Delta \mathbf{A})\hat{\mathbf{x}} = \mathbf{b} + \Delta \mathbf{b} \text{ and } \frac{\|\Delta \mathbf{A}\|_p}{\|\mathbf{A}\|_p} + \frac{\|\Delta \mathbf{b}\|_p}{\|\mathbf{b}\|_p} \leq \alpha \varepsilon_m \quad \varepsilon_m : \text{machine epsilon.} \quad \text{ps: } \alpha \text{ 可以和问题规模 } n \text{ 相关, 但不能和 } \mathbf{A} \text{ 或 } \mathbf{b} \text{ 相关.}$$

Condition Number ($\kappa_p(\mathbf{A})$): $\kappa_p(\mathbf{A}) := \begin{cases} \frac{\|\mathbf{A}\|_p \|\mathbf{A}^{-1}\|_p}{\|\mathbf{A}\|_p} = \|\mathbf{A}^\dagger\|_p \geq 1 & \text{if } \mathbf{A} \text{ is invertible} \\ \infty & \text{otherwise} \end{cases}$ $\begin{cases} \text{If } \kappa_p(\mathbf{A}) \text{ is large (e.g. } \kappa_p(\mathbf{A}) \geq 10^{12} \approx \varepsilon_m^{-1}), & \mathbf{A} \text{ is ill-conditioned.} \\ \text{If } \kappa_p(\mathbf{A}) \leq 10^4, & \mathbf{A} \text{ is well-conditioned.} \end{cases}$ ps: $\kappa_p(\mathbf{A})$ 衡量矩阵奇异性

- For $\mathbf{A}_{n \times n}$ with real eigenvalues $|\lambda_1| \geq |\lambda_2| \geq \dots \geq |\lambda_n|$ and corresponding eigenvectors $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n$: ps: 对所有实对称矩阵都满足下面条件

If $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n$ are orthonormal set. Then $\kappa_2(\mathbf{A}) = \|\mathbf{A}\|_2 \|\mathbf{A}^{-1}\|_2 = \frac{|\lambda_1|}{|\lambda_n|} \geq 1$

Relative Error: $\frac{\|\hat{\mathbf{x}} - \mathbf{x}\|_p}{\|\mathbf{x}\|_p}$ **Actual Error:** $\|\hat{\mathbf{x}} - \mathbf{x}\|_p$ ps: Relative error gives more information than actual error.

- Let $\mathbf{Ax} = \mathbf{b}$ and $(\mathbf{A} + \Delta \mathbf{A})\hat{\mathbf{x}} = \mathbf{b}$. If $\kappa_p(\mathbf{A}) \frac{\|\Delta \mathbf{A}\|_p}{\|\mathbf{A}\|_p} < 1$ then $\frac{\|\mathbf{x} - \hat{\mathbf{x}}\|_p}{\|\mathbf{x}\|_p} \leq \frac{\kappa_p(\mathbf{A})}{1 - \kappa_p(\mathbf{A}) \frac{\|\Delta \mathbf{A}\|_p}{\|\mathbf{A}\|_p}} \cdot \frac{\|\Delta \mathbf{A}\|_p}{\|\mathbf{A}\|_p}$. ps: $\frac{\|\Delta \mathbf{A}\|_p}{\|\mathbf{A}\|_p}$ $\frac{\|\Delta \mathbf{b}\|_p}{\|\mathbf{b}\|_p}$ 小代表 good stability.
- Let $\mathbf{Ax} = \mathbf{b}$ and $(\mathbf{A} + \Delta \mathbf{A})\hat{\mathbf{x}} = \mathbf{b} + \Delta \mathbf{b}$. If $\kappa_p(\mathbf{A}) \frac{\|\Delta \mathbf{A}\|_p}{\|\mathbf{A}\|_p} < 1$ then $\frac{\|\mathbf{x} - \hat{\mathbf{x}}\|_p}{\|\mathbf{x}\|_p} \leq \frac{\kappa_p(\mathbf{A})}{1 - \kappa_p(\mathbf{A}) \frac{\|\Delta \mathbf{A}\|_p}{\|\mathbf{A}\|_p}} \cdot (\frac{\|\Delta \mathbf{A}\|_p}{\|\mathbf{A}\|_p} + \frac{\|\Delta \mathbf{b}\|_p}{\|\mathbf{b}\|_p})$.

2.2 LU Factorization | Gaussian Elimination (GE)

Def of LU: If $\mathbf{A}_{n \times n}$ is invertible, then $\exists \mathbf{L}, \mathbf{U}$: 单位下三角, $\exists \mathbf{U}$: 可逆上三角. s.t. $\mathbf{A} = \mathbf{LU}$ (**unique**)

LU Factorization: By Gaussian elimination, $\mathbf{A}_{n \times n} = (\prod_{k=1}^{n-1} \mathbf{L}_k)^{-1} \mathbf{U} =: \mathbf{LU}$ $\mathbf{L}_k$: Lower triangular with 1s on the diagonal (by row operation on single column)

- 如果 $\mathbf{L}$ 是单位下三角矩阵, 且只有第 k 列有非零元素在对角线下, 则 $\mathbf{L}^{-1}$ 矩阵是 $\mathbf{L}$ 对角线不动, 其余为相反数.
- 如果 $\mathbf{L}_1, \mathbf{L}_2$ 矩阵是单位下三角矩阵, 且 $\mathbf{L}_1 \mathbf{L}_2$ 仅在第 $1 \sim k | k+1 \sim n$ 列有非零元素在对角线下, 则 $\mathbf{L}_1 \mathbf{L}_2$ 矩阵是他们的“拼接”.
- By LU factorization, $\mathbf{A} = \mathbf{LU} \Rightarrow$ By solving $\mathbf{Ly} = \mathbf{b}$ and $\mathbf{Ux} = \mathbf{y}$, we can solve SLE $\mathbf{Ax} = \mathbf{b}$. 用 **FS** 和 **BS** 算法

Error Analysis of GE: Gaussian elimination is an **unstable** algorithm. (i.e. floating point arithmetic can have a disastrous effect on the computed solution.)

2.3 LUPP | LUCP | GEPP | GECP

Permutation Matrix: For a permutation π , $\mathbf{P}_\pi := [\mathbf{e}_{\pi(1)}, \dots, \mathbf{e}_{\pi(n)}]$ ps: 写的时候是对 i 行第 i 行移动到第 $\pi(i)$ 行. 注意: 用另一方式定义的 $\mathbf{P}_\pi$ 会让后面对 π 结论不一样

- 左边乘 $\mathbf{P}_\pi$: 交换行 ($\mathbf{P}_\pi$ 的行 代表具体行的交换方法, π 也代表交换行的方法) · 右边乘 $\mathbf{P}_\pi$: 交换列 ($\mathbf{P}_\pi$ 的列 代表具体列的交换方法, π^{-1} 才代表交换列的方法)
- Proposition: $\mathbf{P}_\pi$ is orthogonal, i.e. $\mathbf{P}_\pi^\top = \mathbf{P}_\pi^{-1}$ · 对于二阶置换矩阵 (**Involution**): $\mathbf{P}_\pi^2 = \mathbf{I}$, i.e. $\mathbf{P}_\pi^{-1} = \mathbf{P}_\pi$ · **GEPP|GECP**: 交换行 (行和列) 使每次 $|u_{kk}|$ 最大 (**stable**)

Backward Stable of GEPP: $\forall$ SLE sol $\hat{\mathbf{x}}$ by GEPP, $\exists \Delta \mathbf{A}$ s.t. $(\mathbf{A} + \Delta \mathbf{A})\hat{\mathbf{x}} = \mathbf{b}$ and $\frac{\|\Delta \mathbf{A}\|_\infty}{\|\mathbf{A}\|_\infty} \leq p(n) 2^{n-1} \varepsilon_m$ $p(n)$ is a cubic polynomial

2.4 QR Factorization Method

QR Factorization: QR factorization of $\mathbf{A}_{n \times n}$ is $\mathbf{A} = \mathbf{QR}$, where $\mathbf{Q}$ is orthogonal (i.e. $\mathbf{Q}^T = \mathbf{Q}^{-1}$) and $\mathbf{R}$ is non-singular upper triangular.

- Def of $\mathbf{Q}$ is orthogonal is equivalent to $\mathbf{Q}^T \mathbf{Q} = \mathbf{I}$. (i.e. columns of $\mathbf{Q}$ forming an orthonormal set.) · QR produce **large errors**
- **Orthogonal Projection:** $\text{proj}_{\mathbf{u}}(\mathbf{x}) = \frac{\mathbf{x} \cdot \mathbf{u}}{\|\mathbf{u}\|_2^2} \mathbf{u} = (\mathbf{u}^\top \mathbf{x}) \mathbf{u}$ if $\|\mathbf{u}\|_2 = 1$. $\mathbf{x} = \text{proj}_{\mathbf{u}}(\mathbf{x})_{\text{parallel to } \mathbf{u}} + (\mathbf{x} - \text{proj}_{\mathbf{u}}(\mathbf{x}))_{\text{orthogonal to } \mathbf{u}}$

Error Analysis of MGS: The matrices $\hat{\mathbf{Q}}$ and $\hat{\mathbf{Q}}$ computed by MGS satisfies: $\hat{\mathbf{Q}}^\top \hat{\mathbf{Q}} = \mathbf{I} + \Delta \mathbf{I}$ $\hat{\mathbf{Q}} \hat{\mathbf{R}} = \mathbf{A} + \Delta \mathbf{A}$ where:

$$\|\Delta \mathbf{I}\|_2 \leq \frac{\alpha_1(n) \varepsilon_m \kappa_2(\mathbf{A})}{1 - \alpha_1(n) \varepsilon_m \kappa_2(\mathbf{A})}, \text{ if } 1 - \alpha_1(n) \varepsilon_m \kappa_2(\mathbf{A}) > 0 \quad \|\Delta \mathbf{A}\|_2 \leq \alpha_2(n) \varepsilon_m \|\mathbf{A}\|_2 \text{ ps: } \alpha_1(n), \alpha_2(n) \text{ 只由 } n \text{ 决定}$$

2.5 Householder QR factorisation

Householder QR: (Most) **stable** algorithm **Householder Reflection Matrix:** $\mathbf{H}(\mathbf{w}) := \mathbf{I} - 2 \frac{\mathbf{w} \mathbf{w}^\top}{\|\mathbf{w}\|_2^2}$ $\mathbf{H}(\mathbf{w}) \mathbf{x} = \mathbf{x} - 2 \text{proj}_{\mathbf{w}}(\mathbf{x})$

- $\mathbf{H}(\mathbf{w})$ is **orthogonal** and **symmetric** (In the Algorithm is $\mathbf{Q}_k, \mathbf{H}_k$) · $\mathbf{H}(\mathbf{w}) \mathbf{x}$ 作用为让 $\mathbf{x}$ 向量对 $\mathbf{w}$ 的法向量 (超平面) 上进行反射

Error Analysis of Householder QR: Let $\hat{\mathbf{x}}$ denote sol of $\mathbf{Ax} = \mathbf{b}$ by Householder QR+SQR. Then $(\mathbf{A} + \Delta \mathbf{A})\hat{\mathbf{x}} = \mathbf{b}$, where $\|\Delta \mathbf{A}\|_2 \leq \alpha n^{\frac{5}{2}} \varepsilon_m \|\mathbf{A}\|_2$ α small constant

3 Iterative Methods for SLE & Polynomial Fitting

Iterative Method: For SLE $\mathbf{Ax} = \mathbf{b}$, if $\mathbf{A} = \mathbf{M} + \mathbf{N}$ with $\mathbf{M}$ is **simpler structure** than $\mathbf{A}$. (例如: 对角/三角/对称矩阵) $\Rightarrow$ 迭代求近似解 $\text{Diff choices } \mathbf{M}, \mathbf{N} \rightarrow \text{different iterative methods.}$

Error Analysis: Error $\mathbf{e}_k := \mathbf{x} - \mathbf{x}_k \Rightarrow \mathbf{e}_k = \mathbf{R}^k \mathbf{e}_0$ $\mathbf{R} := -\mathbf{M}^{-1} \mathbf{N}$ **Theorem:** If $\|\mathbf{R}\|_p < 1$, then $\lim_{k \rightarrow \infty} \|\mathbf{e}_k\|_p = 0 \Leftrightarrow \lim_{k \rightarrow \infty} \mathbf{x}_k = \mathbf{x}$ (Convergence) **GAU** 收敛快于 **JAC**

JAC|GAU: If $\mathbf{A}$ is **strictly diagonally dominant** [i.e. $|a_{ii}| > \sum_{j \neq i} |a_{ij}| \forall i$ (对角线元素大于该行其他元素之和)], then converges for $p = \infty$. For $p = 1$ 看列和/转置.

Vandermonde Matrix: $\mathbf{A} \in \mathbb{R}^{n \times m}$ s.t. $a_{ij} = a_i^{j-1}$ **Poly:** Deg $m - 1$ poly fit to points: $\{(a_i, b_i)\}_{i=1}^n$ by solving $\mathbf{Ax} = \mathbf{b} \Rightarrow$ sol $\mathbf{x}$ is coeff. of poly $p(x) = \sum_{j=1}^m x_j x^{j-1}$

LSP: Finding **line** which best fits $\{(a_i, b_i)\}_{i=1}^n$ by **minimise** $\|\mathbf{Ax} - \mathbf{b}\|_2$, $\mathbf{A} \in \mathbb{R}^{n \times 2}$ vandermonde. **Thm:** **minimises** $\|\mathbf{Ax} - \mathbf{b}\|_2 \Leftrightarrow$ solve **Normal Equations** $\mathbf{A}^\top \mathbf{Ax} = \mathbf{A}^\top \mathbf{b}$

Moore-Penrose Pseudo-inverse of $\mathbf{A}$: $\mathbf{A}^\dagger = (\mathbf{A}^\top \mathbf{A})^{-1} \mathbf{A}^\top$ · **Normal Equations** has **unique sol** if $\mathbf{AA}^\top$ invertible. · If $\mathbf{A}$ invertible, $\mathbf{A}^\dagger = \mathbf{A}^{-1}$ ps: 范德蒙德矩阵 ill-cond.

5.1 Useful Theorems/Formulas

Rank Theorem: These statements are equivalent: $[\mathbf{Ax} = \mathbf{0} \text{ iff } \mathbf{x} = \mathbf{0}] \Leftrightarrow [\text{columns of } \mathbf{A} \text{ are linearly independent}] \Leftrightarrow [\mathbf{A} \text{ is invertible}] \Leftrightarrow [\text{rank}(\mathbf{A}) = \text{rank}(\mathbf{A}^\top) = n]$

Diagonalisable: $\mathbf{A}$ is diagonalisable iff have n LI eigenvectors. (e.g. symmetric matrix - Spectral Theorem) | Always has Jordan Form.

Spectral Theorem: If $\mathbf{A}$ is symmetric, then $\exists$ orthonormal $\mathbf{Q}$ s.t. $\mathbf{A} = \mathbf{Q}^\top \mathbf{\Lambda} \mathbf{Q}$ (Orthogonally diagonalisable) $\mathbf{\Lambda} = \text{diag}(\lambda_1, \dots, \lambda_n)$

5.2 Others

Where the error come from calucation:

1. If your calculation involves 15 or more significant digits, you will likely encounter rounding errors. (Since $\varepsilon_m \approx 10^{-16}$ (relative accuracy), which is about 15 significant digits.)
2. **For GE Algorithm:** It is an unstable algorithm. e.g. $\mathbf{A} = [10^{-20} \ 1 \ \backslash \ 1 \ 1] \Rightarrow$ By GE Algorithm, $\tilde{\mathbf{L}}\tilde{\mathbf{U}} = \mathbf{A} + [0 \ 0 \ \backslash \ 0 \ -1]$ (error)
3. **MGS vs. GS:** In floating point arithmetic, the computed vectors $\{\hat{q}_1, \dots, \hat{q}_{j-1}\}$ will not be orthonormal. Algorithm MGS takes this into account when computing $\hat{q}_j$; Algorithm GS does not.
